Molecular Basis of Thyroid Hormone Action focuses on the actions of thyroid hormones in eukaryotic cells. This book discusses the profound effects of thyroid hormones on the growth, development, and metabolism of practically all tissues of higher organisms.

Organized into 15 chapters, this volume starts with an overview of the kinetic interrelationships of hormone bound to specific receptors and hormone associated with other tissue and plasma pools in living animals.

This book then discusses the thyroid hormone receptor, a chromatin-associated protein that appears to mediate the actions of the thyroid hormones in mammalian cells. Other chapters consider the localization of the receptors in chromatin. This book further discusses how thyroid hormones stimulate the accumulation of specific mRNA molecules in cell culture as well as in tissues in vivo.

This book is intended for readers who are interested in cell and molecular biology. Endocrinologists will also find this book extremely useful.
